List of Workshop Manual Repair Groups

Repair Group

00 - Technical data

Technical information should always be available to the foremen and mechanics, because their careful and constant adherence to the instructions is essential to ensure vehicle road-worthiness and safety. In addition, the normal basic safety precautions for working on motor vehicles must, as a matter of course, be observed.

00 – Technical data

1 Introduction

(VRL012846; Edition 03.2019)

WARNING

The information contained herein is a reference for the importer, since the material cited in this Manual may not exist on the market.

2 Safety at the working area

2.1 Product handling

The efficiency of a painting and repainting operation requires attention to all stages of preparation and safety of the process. A few basic rules to reach the best results are described below:

- 1 - Do not smoke in the areas reserved for repainting, as well in the paint storage location. Avoid repaints at locations with risk of sparks, high temperatures or flames.
- 2 - The floor should be slip-resistant and oil-free, grease and other slippery substances.
- 3 - The area indicated for painting must feature signalled emergency doors, as well as firefighting equipment (extinguishers).
- 4 - Store the paint and solvent cans covered and in an appropriate location, well organized and ventilated, so as to protect the products against sparks.
- 5 - Always read with attention the instructions on the packaging labels.
- 6 - Use personal protective equipment (PPEs): gloves, safety boots, safety goggles, aprons, facial masks and facial and ear protectors.
- 7 - It is an environmental crime to dump residues (painting cabin smudge, solvents, paints and flammable products) on the ground, in the water or the air.
- 8 - The appropriate disposal of residue must be carried out according to guidelines from the competent organisms.
- 9 - Never store food along with chemicals.

2.2 Wear individual protection equipment (IPE)

More than an obligation, Individual Protection Equipment (IPE) must be indispensable working tools during the execution of an automotive repair work. Aiming at preventing accidents, these items become mandatory equipment. The IPEs are tools that ensure the integrity of the worker.

For automotive repair, the main IPEs use are:

Protection Goggles

During activities of tack welding, grinding and surface smoothing down, the worker exposes himself or herself to chips of the part, that may occur during this type of work. When handling chemical, the goggles also prevent the contact of chemicals that may attack vision, and are, therefore, great allies in avoiding damages to the eyes.

Note

If necessary, consult the eye doctor on more appropriate glasses or contact lenses.

Gloves and Shoes

The gloves are important both for the preparation of products and for the use of them, and protect the painter's skin against the action of chemicals. They offer safety and comfort to the tinker in his

or her activities. The flanges and corners of the plates make the risk of cutting your hands even larger. Another function of the gloves is to offer more sensitivity to recognize defects on the surfaces of the parts. They should not be used during M.I.G. / M.A.G welding activities. / M.A.G.

The shoes with slip-resistant soles are also worn for the protection of the feet, in case of falling objects or tools.

Protection masks of the air ways

Indicated for the protection against impurities launched in the environment during the execution of works involving painting, dry grinding and welding.

Masks with activated carbon should be worn.

Ear Protectors

Mandatory use in environments with a noise level above 85dB (decibels). There are four types:

- 1 - Plug type, in PVC 3 sizes (disposable)
- 2 - Cylindrical mouldable foam type (disposable)
- 3 - Conical mouldable foam type (disposable)
- 4 - Shell type

Facial Protector

When grinding requires a larger smoothing down, it is necessary to wear a facial protector since debris resulting from this type of work are much larger and fly at a much higher speed than normal.

2.3 Important safety items in the repainting workshop

2.3.1 Fire extinguishers

These are indispensable pieces of equipment and their presence is mandatory in workshops. They must be annually loaded and inspected every month.

The types of extinguishers vary according to their use in:

Class A Fire

Fire derived from solid combustible material (paper, cloth, plastic, etc. that burns deeply and on the surface, and leaves residue. In case of this type of fire, use a pressurized water type extinguisher that will extinguish fire by cooling.

Class B Fire

Fire derived from flammable combustible liquids and leaves no residue and burn on the surfaces (paints, solvents, thinners, etc.). Use Dry or CO Chemical Powder extinguisher that will extinguish the fire by smothering.

Class C Fire

Fire derived from electrical risks (sparks), originating from energized equipment (sockets, electrical panels, wiring, etc.). Use Chemical Powder or CO₂ extinguisher, that will extinguish the fire by smothering.

Note

The workshop employees must go through theoretical and practical training to handle the extinguishers.

2.3.2 Ventilation

The paint handling or application environment must feature local exhaust ventilation, as the concentration of solvents, in addition to being harmful to health, is a source of ignition, where fire and explosions may occur.

2.4 Storage of chemicals

Try to store the material used in the painting of the vehicle in a separate, covered and ventilated location, in metallic cabinets.

2.4.1 Grounding

In order to prevent risks of static electricity, all pieces of equipment must be grounded.

2.4.2 Electrical Installations

Wiring must be in metallic conduits and the sockets must be protected and armoured against solvent vapours. The lamps must be protected against accidental hits and, in the painting area they must be armoured, to avoid solvent vapours.

2.4.3 Location of the painting section

Due to the permanent use of flammable products, the painting section must be located away from the welding, spark, flame locations and should preferably have partition walls.

2.5 Environment and disposal of paints

Safety and Environment are two major topics in everyday life everywhere in the world. Considering it is a repainting shop, the situation becomes even more serious, because people handle all the time toxic flammable chemicals that may be aggressive to the human being and the environment, which is a reason to be prepared to work with, handle and dispose of these products safely.

We will analyse separately each item due to its degree of importance and we will present suggestions for the execution of the job with safety and quality. We are all responsible for our children and future generations, caring for our water, air, earth and all living beings in our environment.

2.5.1 Residues

Residues are grout, sludge, contaminated packaging, contaminated papers, remains of paint, etc.; in other words, everything that is left over during a repainting process and has not been reused.

In the workshop, these are the type of residues that will present risk to the environment if their disposal is not appropriate. The workshop must prepare to carry out the disposal of each one of these items:

- ◆ Paint leftovers
- ◆ Dirty cleaning solvents
- ◆ Empty dirty packaging
- ◆ Contaminated paint filters

- ◆ Papers with paint dirt
- ◆ Dirty cotton / cloths

2.5.2 Paint leftovers

These must be stored in well closed metallic drums in order to prevent evaporation and contamination of the environment.

Note

Paints with aluminium must be eliminated in separate drums, since, when they get in contact with other paints, they may cause combustions and, since they are flammable materials, in case of fire, no water should be used, only dry sand.

2.5.3 Disposal of grout and empty packages

Grout may be traded with specialized paint recovery companies that are registered with environmental organisms. Hence, before selling this paint leftovers, it is necessary to request an authorization issued by government environmental organisms, thus avoiding risks to the environment, as well as civil and criminal responsibility.

2.5.4 Filters, cloths and papers

Certain residues, such as filters, floor cleaning leftovers, cotton waste and papers, must be incinerated by companies authorized by the government environmental agency.

Cloths may be recycled, if they are washed by specialized companies

2.5.5 Disposal of cans and drums

Special care must be taken with the disposal of empty drums. We recommend that the trading be done by companies that have an authorization from the government agency. The logo of the product manufacturing company must be eliminated (painted over), since the reuse of this container is out of the control of the manufacturer.

2.5.6 Rain waters, sewage and earth

Never throw paint leftovers, grout or solvents directly in a rain water grille, sewage systems or on land, due to the risk of fire, explosion and environmental contamination.

Follow the guidelines described above.

By following these guidelines you will be contributing toward a healthy environment, obtained for the benefit of all, without compromising the quality of life of future generations to fit their needs.

2.5.7 Risk of chemicals

Get to know the risks of and care for the chemicals you handle:

- ◆ Never remove the labels from packaging, as they serve as a safety guide.
- ◆ The reuse of chemical packaging for any purpose is prohibited.
- ◆ Check the condition of conservation of packaging, before you handle it.
- ◆ Drums shall never be opened by using welding torches and chisels, especially those that contain flammable products

- ◆ Do not use flammable liquids to clean the skin or pieces of equipment, especially those in movement or heated.

1 - FLASH RED; CODE → D8D8; L NUMBER → L-P3G

5 Paints

Paint is a pigment liquid, produced from the dispersion of solvents, resins and pigments. Once it is applied to a surface, the paint forms an adherent film that provides colour, shine and protection to the vehicle.

5.1 Basic composition of paints

Resin

Also called **vehicle**, it functions as a liquid support for the pigment. It is responsible for the adherence of the paint to the surface. The resin determines the type of paint (Polyester Base, Polyurethane Enamel, Nitrocellulose and Synthetic).

Pigment

A solid substance, finely ground (in the form of powder), is dispersed in the resin, which provides to the dry film certain characteristics such as colour, opacity, covering and protection.

Pigments with anti-corrosive properties

These are present in the composition of base paints (primers). They have the property of blocking rust.

Additive

Is added to the paint in small quantities to confer special properties such as spread, gloss etc. The additives also have the function to prevent problems such as blisters, pits (fish eye) etc.

Solvent

Used for binding (mixture) of the pigment to the resin. It controls viscosity, spread and application. The film is formed after their evaporation.

5.2 Types of paints

For repainting, four types of paint may be applied: Synthetic Enamel, Polyurethane (PU) Enamel and Polyester Based.

Synthetic Enamel

Paint based on resin with glossy finish.

- ◆ Traditional technology
- ◆ Slow drying
- ◆ Low resistance to weather
- ◆ Smooth (solid) colours

Polyurethane (PU) Enamel

Polyurethane based paint, also known as PU paint. It needs a catalytic converter for application and drying.

- ◆ High technology
- ◆ Slow drying
- ◆ Bicomponent paint (paint + catalytic converter)
- ◆ High brightness
- ◆ High resistance to chemicals and weather
- ◆ Smooth (solid), metallic or pearly colours

Polyester Base + PU Varnish

Polyester Base: Product based on polyester resin, used as base prior to application of varnish. It needs the application of varnish

over the paint in order to gain brightness and resistance, and will then have characteristics similar to those of PU paint.

- ◆ High technology
- ◆ Quick drying
- ◆ No resistance to chemicals or weather (without the application of varnish)
- ◆ Mat (without the application of varnish)
- ◆ Smooth (solid), metallic or pearly colours

Polyurethane (PU) Varnish

Its application is necessary after the painting with polyester base, since this paint does not feature sufficient brightness or resistance to weather. It needs a catalytic converter for application and drying.

Note

Varnish must be catalysed according to manufacturer's recommendation.

6 Complements

These are auxiliary products use in repainting:

- ◆ Thinners / Solvents / Diluents ➤ [page 168](#)
- ◆ Rust neutralizers ➤ [page 168](#)
- ◆ Sealing and protection of the lower part of the vehicle (paste for body repair) ➤ [page 168](#)
- ◆ Grinding control ➤ [page 169](#)
- ◆ Primers ➤ [page 169](#)
- ◆ Polyester paste ➤ [page 169](#)
- ◆ Single-component polyurethane sealants ➤ [page 169](#)
- ◆ Abrasives ➤ [page 170](#)

6.1 Thinners / Solvents / Diluents

Thinner, in English, means a viscosity reducer. Basic functions: reduce the viscosity of paint (make paint thinner), thus allowing a better application of the paint, as well as spread and drying. Thinner evaporates totally after the drying of the paint. Depending on the region or the manufacturer, thinner is also commercialized with the denominations of Reducer, Solvent or Diluents.

6.1.1 Basic composition

Thinner is normally a solution originated from the mixture of several raw materials derived from petroleum (aromatic carbides), several types of acetate and ethanol.

6.1.2 Types of thinners

There is a specific thinner for each type of paint. Use thinner according to manufacturer's specification. Never use thinner that is not indicated, as this may render useless the properties of the paint, and may compromise the paint. If in doubt, consult the reseller or the manufacturer.

There are also thinners and solvents specifically used for cleaning guns or parts.

6.2 Rust neutralizers

During the treatment of the surface to be painted, all traces of rust must be eliminated by grinding or with steel brushes. Once the gross rust is eliminated, a rust neutralizer or deoxidant has to be applied, as described by the manufacturer.

6.3 Sealing and protection of the lower part of the vehicle

Product is based on acrylic emulsion, water and additives.

Application

Gun for application.

Use

indicated for protection of the lower parts of the vehicle (floor, mud-flap) against the action of rain, sea mist and impact of stones. Reduces the effects of vibrations and provides additional protection to doors, luggage compartment, floors, and other parts, against noise and corrosion.

Hints

- In order to obtain better adherence, always apply sealing and protection over a primer.
- Clean the gun with water.

6.4 Sanding control

Product used to control sanding of paste and primer. Facilitates viewing of conditions of the surface for application of the following product

6.5 Primers

Products used in surface preparation to receive the finishing.

6.5.1 PU Primer

High-technology products, used for surface stuffing, levelling it according to the irregularity shown. Provides good insulation of other layers and ensures adherence of paint to the finishing.

6.6 Polyester paste

Putties are products used for the repair of small surface imperfections.

Application

- Manual applicator (celluloid)

Use

- For correction of small surface imperfections. May only be applied over primer, since, if otherwise, it may show bubbles and debonding.

Hint

- In order to obtain better drying, always use the paste in thin layers.

6.6.1 Body repair paste

Rubber-base paste and synthetic resins dispersed in solvents.

Application

- Brush or scraper.

Use

- For the caulking of bodies, floors, gaskets and slots of automobiles to prevent the penetration of water and dust.

6.6.2 Polyurethane-based sealing adhesive (thread)

Single-component PU adhesive

Application

Method of Application: Directly from the product packaging, using the application gun or the pneumatic applicator. Surfaces must be free of oil residues

Use

Used to seal body panel joints against the penetration of water and dust.

6.6.3 Polyester Paste

Polyester paste is a high-technology product that is easy to grind, and has good flexibility and adherence. It is used for correction of small surface failures and has a high stuffing power

6.7 Abrasives

Abrasives are tools made up by abrasive grains that execute the work of cutting, smoothing down and polishing surfaces. Abrasives have forms and dimensions appropriate for each step of the automotive repair process. Sandpapers, polishers, cutting discs and smoothing down discs are the most common abrasives used in repair.

6.7.1 Polishers

Polishers are liquid or pasty abrasives used to improve the gloss and the finish, and to restore the aspect of old paints and opaque surfaces caused by exposures to weather or due to repainting.

7 Repainting

7.1 Paint Repair

7.1.1 General information

The condition for a good craft painting is that the workplace, the tools and the pieces of equipment are always in clean condition. In order to keep the paint as free from dust as possible, it is indispensable to install a good ventilation and exhaust system.

This is also necessary in order to prevent the formation of explosive mixtures of air and vapours of solvent. In the painting cabinet (painting compartment) there should be a permanent overpressure. Therefore an airflow speed of 0,3 m/s is sufficient. Greater speeds results in failures in the process, such as: loss of brightness, formation of creases and excessively fast surface drying.

The products must be maintained and handled according to manufacturer's instructions, to prevent the emergence of failures in the process or drying and to maintain the warranty against perforation due to corrosion.

The ambient temperature must be between 20 and 25 °C. Lower or higher temperatures may cause pores and a poor-quality process. High air humidity may result in damages to paint, such as: stains in the paint layer (matt layer), lack of adherence and depressions.

Treatment principles:

- ◆ The part to be painted may not contain remains from sanding and salts.
- ◆ The humidity of sanding must dry well. This takes approx. 2 hours at an ambient temperature of +20 °C.
- ◆ The part to be painted must be clean, without oiliness and dry.
- ◆ Also avoid and remove sweat from the hands on the part to be painted.
- ◆ The part to be painted must be at the same temperature of the environment at the time of application of the material, this way condensation of water is prevented.
- ◆ The air spray must be dry. Oil and water drip trays must be emptied and controlled at regular intervals.

7.2 Paint repair on steel plates and zinc-coated steel plates

The principle of a painting without any problem depends on the correct preparation of the base. Undamaged new parts are supplied by P&A with primer applied, and may already receive the base (colour) and varnish.

7.2.1 Solid paint - solid colours

WARNING

The repainting procedure covers the plain plate and the application of varnish. Observe the steps to be performed in function of the affected layer.

Pre-treatment:

- Sand the surface with P 150 and P 400 sandpaper.
- Apply degreasing solution.

Correction of imperfections:

- Correct imperfections with polyester paste, by following the manufacturer's specifications (Polyester paste + catalyst).
- Dry the polyester paste (air or short waves).
- Sand with P 80 sandpaper

Note

With a sanding club or with a sanding machine or then with a vacuum plan.

Sanding control:

- Control the sanding process (spray or dust)
- Sand with P 150 and P 240 sandpaper

Note

With a sanding club or with a sanding machine or then with a vacuum plan.

Cleaning:

- Apply degreasing solution.

Anticorrosive protection:

- Apply a phosphatizing primer by following the manufacturer's specification (phosphatizing primer + catalyst).

Note

With an HVLP spray gun, with an opening and line pressure specified by the manufacturer, 1 or 2 coats.

- Dry the phosphatizing primer in air (time specified by manufacturer).

Surface preparation:

- Apply PU primer by respecting manufacturer's specification (PU primer + catalyst + diluent)

Note

With HVLP spray gun, with spread and line pressure as specified by the manufacturer, 2 or 3 coats.

- Dry the PU primer in air or short waves (time specified by the manufacturer).
- Sand with P 400 and P 500 sandpaper

Note

With a sanding club or with a sanding machine or then with a vacuum plan

Cleaning:

- Apply degreasing solution.

Application of coating:

- Apply the coating paint by respecting manufacturer's specification (coating paint + catalyst + diluent).

Note

With HVLP spray gun, with spread and line pressure as specified by the manufacturer, 2 or 3 coats.

- Dry the coating paint in air or in oven (time specified by manufacturer).

7.2.2 Double-layer paint (solid, metallic and pearly colours)

WARNING

The repainting procedure covers the plain plate and the application of varnish. Observe the steps to be performed in function of the affected layer.

Pre-treatment:

- Sand the surface with P 150 and P 400 sandpaper.
- Apply degreasing solution.

Correction of imperfections:

- Correct imperfections with polyester paste, by following the manufacturer's specifications (Polyester paste + catalyst).
- Dry the polyester paste (air or short waves).
- Sand with P 80 sandpaper

Note

With a sanding club or with a sanding machine or then with a vacuum plan

Sanding control:

- Control the sanding process (spray or dust)
- Sand with P 150 and P 240 sandpaper

Note

With a sanding club or with a sanding machine or then with a vacuum plan

Cleaning:

- Apply degreasing solution.

Anticorrosive protection:

- Apply a phosphatizing primer by following the manufacturer's specification (phosphatizing primer + catalyst).

Note

With HVLP spray gun, with spread and line pressure as specified by the manufacturer, 1 or 2 coats.

- Dry the phosphatizing primer in air (time specified by manufacturer).

Surface preparation:

- Apply PU primer by respecting manufacturer's specification (PU primer + catalyst + diluent).

Note

With HVLP spray gun, with spread and line pressure as specified by the manufacturer, 2 or 3 coats.

- Dry the PU primer in air or short waves (time specified by the manufacturer).
- Sand with P 400 and P 500 sandpaper

Note

With a sanding club or with a sanding machine or then with a vacuum plan.

Cleaning:

- Apply degreasing solution.

Application of base:

- Apply the base by respecting manufacturer's specification (base + catalyst + diluent).

Note

With HVLP spray gun, with spread and line pressure as specified by the manufacturer, 2 or 3 coats.

- Dry the base in air or in the oven (time specified by manufacturer), until matting

Application of varnish:

- Apply the varnish by respecting manufacturer's specification (varnish + catalyst + diluent).

Note

With an HVLP spray gun, with an opening and line pressure specified by the manufacturer, 2 coats

- Dry the varnish in air or short waves (time specified by the manufacturer).

7.2.3 Water-based double-layer paint (smooth, metallic and pearly colours)

WARNING

The repainting procedure covers the plain plate and the application of varnish. Observe the steps to be performed in function of the affected layer.

Pre-treatment:

- Sand the surface with P 150 and P 400 sandpaper.
- Apply degreasing solution.

Correction of imperfections:

- Correct imperfections with polyester paste, by following the manufacturer's specifications (Polyester paste + catalyst).
- Dry the polyester paste (air or short waves).
- Sand with P 80 sandpaper

Note

With a sanding club or with a sanding machine or then with a vacuum plan.

Sanding control:

- Control the sanding process (spray of dust)
- Sand with P 150 and P 240 sandpaper

Note

With a sanding club or with a sanding machine or then with a vacuum plan

Cleaning:

- Apply degreasing solution.

Anticorrosive protection:

- Apply a phosphatizing primer by following the manufacturer's specification (phosphatizing primer + catalyst)

Note

With HVLP spray gun, with spread and line pressure as specified by the manufacturer, 1 or 2 coats.

- Dry the phosphatizing primer in air (time specified by manufacturer).

Surface preparation:

- Apply PU primer by respecting manufacturer's specification (PU primer + catalyst + diluent)

Note

With HVLP spray gun, with spread and line pressure as specified by the manufacturer, 2 or 3 coats.

- Dry the PU primer in air or short waves (time specified by the manufacturer).
- Sand with P 400 and P 500 sandpaper

Note

With a sanding club or with a sanding machine or then with a vacuum plan.

Cleaning:

- Apply degreasing solution.

Application of base (water solvent):

- Apply the base by respecting manufacturer's specification (base + diluent).

Note

With an HVLP spray gun, with an opening and line pressure specified by the manufacturer, 2 + 1/2 coats.

- Air or oven dry the base (time specified by manufacturer), until matting.

Application of varnish:

- Apply the varnish by respecting manufacturer's specification (varnish + catalyst + diluent).

Note

With HVLP spray gun, with spread and line pressure as specified by the manufacturer, 2 coats.

- Dry the varnish in air or short waves (time specified by the manufacturer).

7.3 Paint repair on plastic parts

WARNING

The repainting procedure covers plastic without any preparation up to the application of varnish. Observe the steps to be performed in function of the affected layer.

Normally, primer is already applied to the plastic parts offered by P & A.

Pre-treatment:

- Sand the surface with P 400 and P 600 sandpaper.
- Apply degreasing solution (silicone remover).

Correction of imperfections:

- Correct imperfections with polyester paste for plastics, by following the manufacturer's specifications (Polyester paste for plastics + catalyst).
- Dry the polyester paste for plastics (air or short waves).
- Sand with P 80 sandpaper.

Note

With a sanding club or with a sanding machine or then with a vacuum plan.

Sanding control:

- Control the sanding process (spray or dust)
- Sand with P 150 and P 320 sandpaper

Note

With a sanding club or with a sanding machine or then with a vacuum plan.

Cleaning:

- Apply degreasing solution.

Anticorrosive protection:

- Apply plastic sealant

Note

With HVLP spray gun, with spread and line pressure as specified by the manufacturer, 1 or 2 coats.

- Dry the plastic sealant in air (time specified by manufacturer).

Surface preparation:

- Apply HS primer by respecting manufacturer's specification (HS primer + catalyst + diluent)

Note

With HVLP spray gun, with spread and line pressure as specified by the manufacturer, 2 coats.

- Dry the PU primer in air or short waves (time specified by the manufacturer).
- Sand with P 400 and P 500 sandpaper

Note

With a sanding club or with a sanding machine or then with a vacuum plan.

Cleaning:

- Apply degreasing solution.

Application of base (solvent or water solvent):

- Apply the base by respecting manufacturer's specification (base + diluent).

Note

With an HVLP spray gun, with an opening and line pressure specified by the manufacturer, 2 + 1/2 coats.

- Dry the base in air or in the oven (time specified by manufacturer), until matting.

Application of varnish:

- Apply the varnish by respecting manufacturer's specification (varnish + catalyst + diluent).

Note

With HVLP spray gun, with spread and line pressure as specified by the manufacturer, 2 coats.

- Dry the varnish in air or short waves (time specified by the manufacturer).

7.3.1 Repainting of plastic components that require special care

Side trim Spoiler

1 - Spoiler

- ☐ PC + ABS
- ☐ VDA 260 >PC+ABS<

2 - Area for the application of polyurethane adhesive

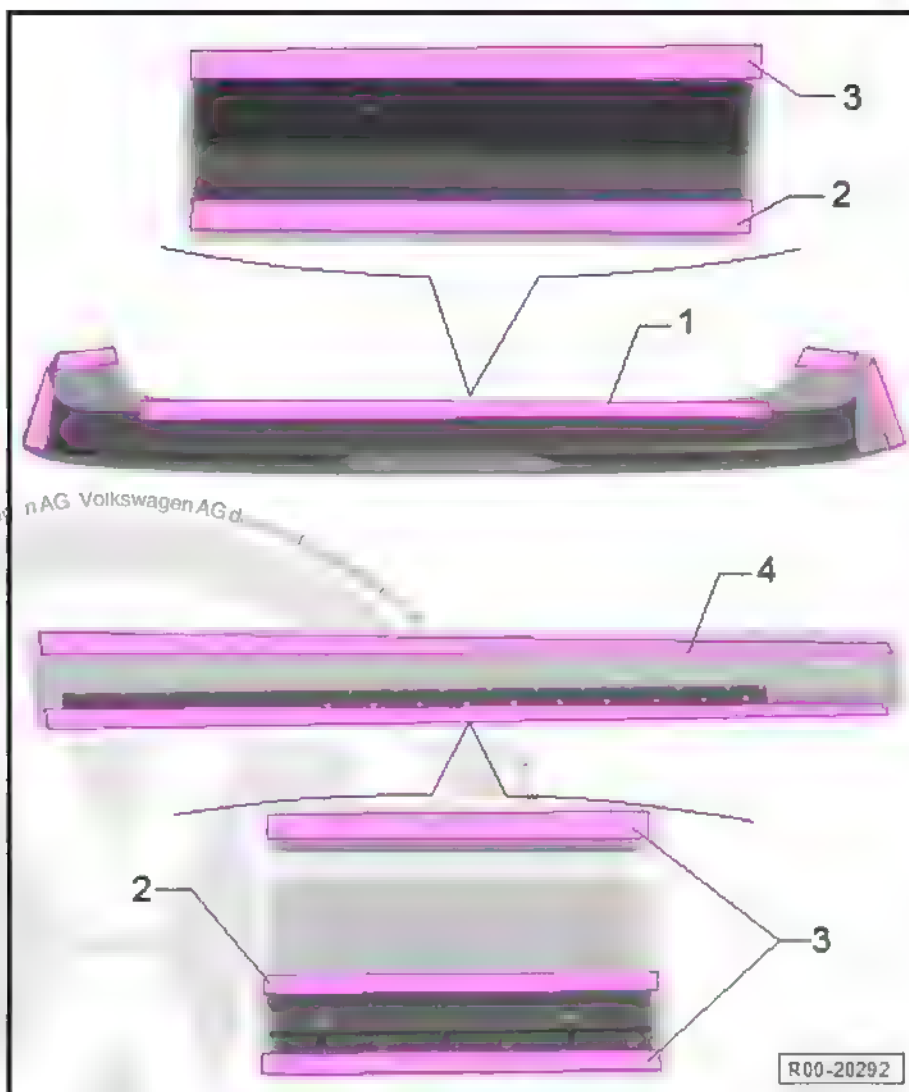

- ☐ Check if the primer layer is firmly adhered.
- ☐ Clean the area with cleaning solution - D 009 401 04- .

3 - Double-sided acrylic adhesive tape

- ☐ PT 1100

4 - Side trim / side member trim

- ☐ PP + EPDM
- ☐ VDA 260 >PP+EPDM+TD10<

Components that require painting in the colour of the vehicle or a special colour, and are fastened by double-sided acrylic adhesive tape -3- and with an area reserved for the application of polyurethane adhesive -2-, must be protected against the action of solvents and paint splashes.

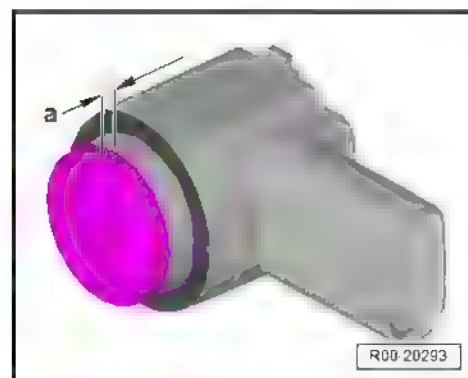

Start by checking the polyurethane adhesive application region for debonding of primer in the region.

Before anything, cover the whole area with paper, by restricting the shown area only to the painted area.

Parking aid sensor - G203 / G204 / G205 / G206-

The parking assist sensors - G203 / G204 / G205 / G206- have a limited area allowed for painting "a". See measurement "a" on the ⇒ electrical equipment; Rep. gr. 94 ; Switches, external lights and lamps - Auxiliary parking system - Parking support sensor - remove and install .

The non-painted region must be covered with paper (protected from the action of the solvent and the paint itself). All layers of the painted area: primer, covering paint and transparent varnish) may not exceed 100 µm (microns)

7.4 Spray guns and their use

The gun is the most important tool for the painter, in order to obtain a perfect-quality painting. With the help of compressed air, the mixed enamel is applied over the surface. Compressed air and enamel pass through the gun via separate channels. The exit point of air and enamel is called the "hot point".

Regulation of the paint gun

The amount of material is determined by the alteration in the length of the enamel needle. Regulation is checked with a sample of paint on cardboard or plate, at an appropriate distance.

With the air passage regulation wheel the work pressure is chosen depending on the material and technical determinations. In addition, it is through the regulation wheel that the form of the spray cone is chosen. A spray cone as a high concentration of enamel, and a small concentration of enamel. The compressed air pressure is also determined by the size of the drops.

High pressure = small paint drops

Low pressure = large paint drops

With the spray regulation it is possible to continuously regulate the round spray to plain spray. In the round spray, the air leaves from the central hole in the air cap. The air channels in the air cap are closed by the regulation screw, so that a conical enamel spray occurs. In the plain spray, the air channels of the bit holes of the horn are released by the opening of the regulation screw. The spray in the form of a cone may now be conformed in the form of an ellipse until the plain spray. By additionally turning the air cap, the spray may come out either vertically or horizontally. +

Use of the paint gun

- ◆ Before painting, check whether the baffle is appropriate for the enamel to be used: heavy filling materials require large baffle opening; less viscous materials require smaller baffle opening. As a matter of principle, a complete set of baffles must always be replaced
- ◆ After regulating the gun, the application of enamel is carried out. The distance to the part to be painted must always be equal.
- ◆ The types of paint guns are classified per high and low pressure guns.

High pressure guns

High pressure guns have the disadvantage of high consumption of energy and material. However, up to now they are the most commonly used ones. The pressure required by them is between 1 - 6 bar. In this case, 1-2.2 mm sized baffles may be used. For 1 l of enamel, an amount of approximately 400 l compressed air is required. An oil purger and a water purger are also absolutely necessary. The high air pressure and the large amount of air necessary cause a strong paint cloud. The consequence is that the efficiency of the application is only approximately 35%.

Low-pressure guns

These are increasingly getting acceptance. They have the advantage of forming a reduced cloud and so the performance rate of the application of enamel is 65 %. The necessary pressure is between 1 - 5 bar. In this case, baffles of sizes 1-2.2 mm may be used. Approximately 300 l of compressed air are for 1 l of enamel.

Several types of spray guns are offered, all designed for specific types of work. They must meet the following criteria

- ◆ Reduced weight

- ◆ Good ergonomics and handling
- ◆ Tireless work and with little physical effort

Cup gun for gravity flow

It is a gun with an enamel cup installed on top. The material reaches the baffle via the force of gravity. At the outlet, the compressed air spray causes a vacuum at the outlet of the air vent, in front of the paint baffle. This vacuum sucks the enamel, which is under atmospheric pressure, from the cup. Attention should be paid so that the pressure compensating hole on the container cover is always open.

Suction cup gun

It is a gun with an enamel cup installed at the lower end. The operation of this gun is almost identical to that of the flow cup gun, via gravity. In this case the enamel is also sucked from the paint cup by the vacuum generated by a compressed air spray.

This type of gun is mainly used in the industrial area, for painting trucks or buses. In this case, the material is conveyed to the spray gun under pressure, as the paint baffle and the air baffle end are aligned, so there is no vacuum to suck the material from the cup. This gun is also used for heavy painting material, or to facilitate the constant refilling of the enamel cup, on large surfaces.

Designer spray gun

This gun is used for the manifold painting of Design and Airbrush. The amount of material of this round spray gun may be changed continuously, hence it is also usable to draw finer lines. The sizes of the baffles are from 0.2 to 1.0 mm, and may be also used for enamels that are soluble in water.

HVLP (NR) Gun

- ◆ H = High
- ◆ L = Low
- ◆ P = Pressure (Sprayer)
- ◆ NR = Reduced cloud

This high-performance gun forms a soft, fine and homogeneous spray. The reduced pressure of 0.7 bar provide a high index of material application with a reduced cloud. The reduced internal pressure of the baffle reduces the regression of the droplets of enamel from the object and so also the parcel of "Overspray". At the same time, less solvent evaporates into the atmosphere. This allows for a wide and uniform application of enamel for high-quality surfaces. It application is primarily intended for water-soluble enamels. However, even in the conventional field it provides excellent results in work with coating and base enamels, as well as with colourless enamels. With the high performance of material, it obtains savings of up to 15% with the coating enamels. The higher productivity thus obtained has also a positive effect on the environmental sociability and the working conditions.

According to a study of the Residue Handling Consultant Baden-Württemberg (ABAG), the advantages are:

- ◆ High degree of productivity of the application
- ◆ Reduced Overspray
- ◆ Lower consumption of material
- ◆ Lower emissions of solvent
- ◆ Reduced volume of waste products
- ◆ Higher durability of the filters
- ◆ Lower maintenance of the painting systems
- ◆ Lower waste sanitation costs

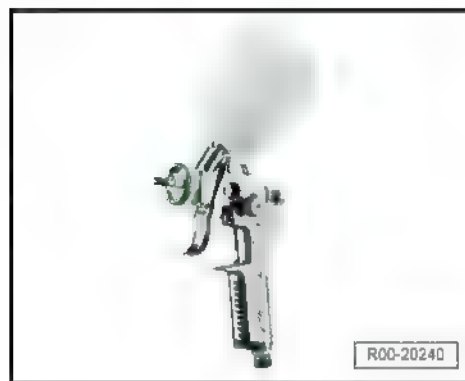

Cleaning of spray guns (painting system with a solvent base)

In order to ensure the good operation of the spray guns for a long time, a careful cleaning is necessary after each use. Otherwise the paint material may dry in a short time, and later its removal is very difficult.

Manual cleaning:

- ◆ After use, clean the enamel cup immediately
- ◆ Rinse the gun with diluent
- ◆ For a careful cleaning the gun must be disassembled
- ◆ Clean the air cap with an appropriate brush
- ◆ For holes and baffles, use only baffle cleaning needles

Automatic gun washing system (paint system with solvent base)

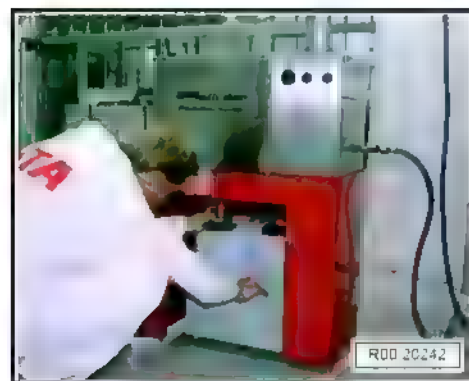

This consists of an hermetically close chamber. The guns and tools to be cleaned are placed in this chamber. After closing the cover, a pneumatic pump is turned on, which distributes the cleaning product in the system. After the cleaning process is finished or when the cover is opened, the pump is turned off

Note

After cleaning the spray gun, remove the diluent in order not to damage the sealing and gaskets.

7.5 Paint dryers by irradiation

These are used mainly for small paint repairs. They require little space and have low operational costs. They are called fixed dryers. Presently dryers via infrared rays are predominantly used. Great improvements are obtained in the paint drying process with them. The infrared rays cross the air and the enamel layer, without direct heating. The steel plate is heated and transmits the heat to the enamel layer.

Note

In order to dry the paint on high-resistance plates, by using the infrared ray dryers, these may be taken to full power only slowly. Otherwise excessively quick heating of the plates causes dilation which later, after cooling down, causes undulations in the bonding or spot-welding area.

Advantages of the infrared technique

- ◆ The drying process occurs from the inside to the outside
- ◆ The flash-off time is shorter than with hot-air systems
- ◆ Quicker drying reduces the risk of dust deposition
- ◆ Efficient use of energy

The IV dryers are divided into three groups:

- ◆ Short-wave dryer
- ◆ Medium-wave dryer
- ◆ Long-wave dryer

The most adequate ones for the drying process are the short-wave and medium-wave dryers.

The short-wave appliances generate the irradiation through quartz tubes. They irradiate in the field of vision and emit a red or orange light. It reaches the working temperature in a few seconds. These appliances have an intensive irradiation with a short flash-off time.

The medium-wave dryers generate the rays by means of ceramic tubes. They irradiate in the non-visual field. They only reach the working temperature after a few minutes. Hence the flash-off times are longer than those with short-wave dryers.

In principle, all materials can be dried with the infrared drying technique.

The flash-off time of the infrared dryers, at a distance of 80 cm, comprises:

- ◆ Polyester scraper = 2 minutes
- ◆ Painting scraper = 2 - 7 minutes
- ◆ Soluble stuffing base in water = 7 - 9 minutes
- ◆ Base = 3 - 8 minutes
- ◆ Covering painting = 7 - 10 minutes

7.6 Dryers based on air insufflation (water-based painting)

These are used mainly for small paint repairs. They require little space and have low operating costs, they insufflate air (Dry jet, for example). With them, great improvements in the drying of the paint process are obtained.

8 Body sealing

8.1 Materials

WARNING

Check the regulations on the disposal of each product and packaging as per manufacturer's guidelines and current legislation at local, state and federal level.

8.1.1 Polyurethane-based sealing adhesive

Trade Name	Packaging	Supplier
Sikaflex 221 - white	310 ml cartridges	SIKA
Sikaflex 221 - black	310 ml cartridges	SIKA

- ◆ Method of Application: Directly from the product packaging, using the application gun or the pneumatic applicator. Surfaces must be free of oil residues.
- ◆ Product use time:
- ◆ Handling time: 30 min. to 1 hour
- ◆ Total drying time: 24 hours
- ◆ Storage life and conditions: 6 months in original packing, in a dry place at 20 to 30°C
- ◆ Suggested solvent: water

MKL 106 14683 - EVW M00000194KL

Supplier

SIKA S/A

www.sika.com.br

8.1.2 Body repair paste

Trade Name	Packaging	Supplier
REPAIR PUTTY	1 KG TINS	VOLKSWAGEN
BRASCOVED ASW 400	1 KG TINS	BRASCOLA
AUTOMOTIVE RUBBERIZING	1 KG TINS	3M
PVC STONE IMPACT ANTI-NOISE PASTE	1 KG TINS	COLAUTO

- ◆ Method of Application: With a brush (use a leather-cloth cartridge to add the material to be used). In applications in which the paste is to be sprayed, use a high pressure tank and a spray gun. Surfaces must be free of oil residues
- ◆ Product use time:
- ◆ Handling time: 1 hours
- ◆ Total drying time: 2 hours (air drying)
- ◆ Storage life and conditions: 6 months in original packing, in a dry place at 20 to 30°C
- ◆ Suggested solvent: water, up to 10% by volume

AKD 450 000

8.1.3 Paste for load bed protection

Trade Name	Packaging	Supplier
STOP NOISE 6979A	20 KG PAILS	HENKEL
STOP NOISE 6979B	5 KG TINS	HENKEL

- ◆ Method of Application: Mix uniformly 1 part of component B (Stop Noise 6979 B) to 4 parts of component A (Stop Noise 6979 A). Apply the mixture with a brush, keeping a thickness of 0.5 to 0.8 mm (layer).
- ◆ Product use time:
- ◆ Handling time:
- ◆ Total drying time: 1 hour at 20 °C. Total hardening in 24 hours at 20 °C or 30 minutes at 50 °C
- ◆ Storage life and conditions: 3 months in the original packaging, kept in a dry place at a temperature between 5 and 25 °C.
- ◆ Suggested solvent:
